# Description

FunnyFaces Inc. has hired your talent to develop a web application that allows a user to upload a picture of their face and it returns that same picture but with googly eyes in place of their actual eyes. Fun for the whole family!

The project owner was kind enough to supply a draft of what the company requires:

Please develop the "Googly Eyes" service, which exposes a single HTTP endpoint which allows a user to upload a photo and returns the same photo but modified with googly eyes in place of their eyes. Googly eyes are funnier if they are slightly randomized both in size and orientation of the pupils, so that's something you should take into consideration when developing your service. It shouldn't also matter if there is one or more people in the photo - all get googly eyes. As stated - this is fun for the whole family!

Also please note that FunnyFaces Inc. is a fun company but takes its users privacy very seriously. The company requires that you **never** store any uploaded picture on your service other than exceptionally for the duration of the request.
